

Technical Data

for the MG Y Series

We often get asked questions on technical matters relating to basic specification data on the MG Y Type, so it seems sensible to make available a printed sheet with all the usual data on it.

Source: Maintenance Manual and Instruction Book for the MG One and a Quarter Litre (Series 'Y') - available as a reprint in full from the MG Octagon Car Club - see [Links](#) page. While every effort has been made to carefully copy and reproduce the data shown accurately, your attention is drawn to our [DISCLAIMER](#).

NB This data is correct for the MG YA and YT - not the MG YB!

MG Y (YA) and MG YT only

ENGINE:

Type: XPAG/SC. Four cylinders, water cooled, with overhead valves, push-rod operated, with detachable head.

Bore	66.5 mm
Stroke	90 mm

PISTON AND CYLINDER BORE SIZES (XPAG Engines)**REPLACEMENT CYLINDER BLOCKS (Normal Standard and Oversize Bores)**

<i>Cylinder bore oversize in thousandths of an inch</i>	<i>Cylinder bore size in mm.</i>	<i>Cylinder bore size in inches</i>	<i>Piston size reference</i>
Standard	66.50	2.6181	A...OK
19.7	67.00	2.6378	C...OK
39.4	67.5	2.6575	E...OK

Note: After oversize "E" the cylinder bores are relined to standard.

Bore sizes will be found stamped on the top front left-hand side of the cylinder block.

STANDARD AND OVERSIZE RANGES

When fitting new pistons selective assemble is necessary, and to facilitate this the pistons are marked on their crowns with an indication of their bore size. Note particularly that the pistons markings indicate the correct size cylinder bore for which they are suitable, the correct working clearance having been allowed in the grading operation. **The piston size should therefore correspond with the marking on top of the face of the cylinder block** on the right-hand side, which indicates the actual size of each cylinder bore.

The bores and pistons are graded in four sizes: –

Bores of normal size $\pm .000$ in. to $+.00049$ in.–marked “STD”

Bores of normal size $\pm .0005$ in. to $+.00099$ in.–marked $+.0005$.

Bores of normal size $\pm .0010$ in. to $+.00149$ in.–marked $+.0010$.

Bores of normal size $\pm .0015$ in. to $+.00199$ in.–marked $+.0015$.

The piston clearance is .0021 in. minimum to .0029 in. maximum (.056 mm. to .073 mm), measured at the top of the skirt, immediately below the oil control ring, and across the thrust faces, i.e. at 90° to the gudgeon pin axis. This is important as the piston skirt is tapered and oval, and the extreme edge of the skirt and clearance can only be measured in this one position. There is .005 in. (.127 mm.) ovality at the extreme bottom edge of the skirt and the clearance measures at 90° to the gudgeon pin centre line at the bottom of the skirt should be .00125 in. (.0317 mm.) less than that at the top.

To facilitate correct measurement of the bores and pistons, the actual sizes of the various gradings are given at the top of page v (*sic see below*).

The markings on the top face of the cylinder block will indicate these sizes clearly.

Oversize bores on reconditioned engines supplied under the M.G. reconditioned engine scheme are limited to two oversizes: –

$+.020$ in. graded in 4 sizes as the standard settings

$+.040$ in. graded in 4 sizes as the standard settings

The actual sizes of these pistons and bores are provided in the tables on the following page (*sic see below*).
